**Description:**

An erect, clump forming plant with stiff stems, producing masses of long blooming, bright yellow daisy flowers with gray capped, dark brown cones at the center; an excellent border or naturalizing plant that is very adaptable; best when massed

**Ornamental Features**

Gray-headed Coneflower has masses of beautiful spikes of yellow daisy flowers with dark brown eyes rising above the foliage from early to late summer, which are most effective when planted in groupings. Its narrow pinnately compound leaves remain bluish-green in color throughout the season.

**Landscape Attributes**

Gray-headed Coneflower is an herbaceous perennial with tall flower stalks held atop a low mound of foliage. Its medium texture blends into the garden, but can always be balanced by a couple of finer or coarser plants for an effective composition.

This is a relatively low maintenance plant, and should be cut back in late fall in preparation for winter. It is a good choice for attracting bees and butterflies to your yard. It has no significant negative characteristics.

Gray-headed Coneflower is recommended for the following landscape applications;

- Accent
- Mass Planting
- General Garden Use
- Groundcover
- Naturalizing And Woodland Gardens
- Container Planting

### **Planting & Growing**

Gray-headed Coneflower will grow to be about 3 feet tall at maturity extending to 5 feet tall with the flowers, with a spread of 24 inches. Its foliage tends to remain dense right to the ground, not requiring facer plants in front. It grows at a medium rate, and under ideal conditions can be expected to live for approximately 5 years. As an herbaceous perennial, this plant will usually die back to the crown each winter, and will regrow from the base each spring. Be careful not to disturb the crown in late winter when it may not be readily seen!

This plant should only be grown in full sunlight. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is not particular as to soil pH, but grows best in poor soils. It is highly tolerant of urban pollution and will even thrive in inner city environments. This species is native to parts of North America. It can be propagated by division.

Gray-headed Coneflower is a fine choice for the garden, but it is also a good selection for planting in outdoor pots and containers. With its upright habit of growth, it is best suited for use as a 'thriller' in the 'spiller-thriller-filler' container combination; plant it near the center of the pot, surrounded by smaller plants and those that spill over the edges. It is even sizeable enough that it can be grown alone in a suitable container. Note that when growing plants in outdoor containers and baskets, they may require more frequent waterings than they would in the yard or garden.

### **Native Plant Options**

Native plants are gaining back their popularity with home gardeners. Be apart of this growing community by purchasing your own native varieties.
